

Hepatitis C Virus (HCV)

CHRs can save lives

Brigg Reilley, Epidemiologist

January 2025

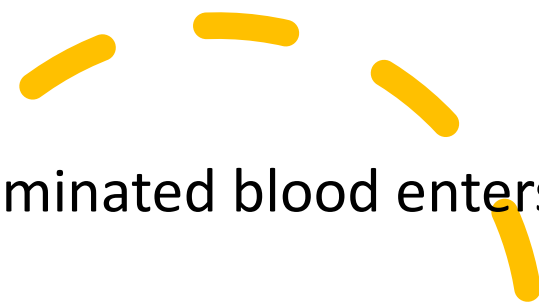

Most important points

- Millions of persons in the US have HCV
 - Most persons with HCV have no symptoms
 - HCV is a leading cause of liver cancer
 - HCV is nearly 100% curable
 - **LINKING PATIENTS TO TREATMENT WILL SAVE LIVES**
- 

HCV transmission

Almost all bloodborne, “contaminated blood enters the body of another person”

- Before 1992 medical exposure, transfusion
- Non-professional tattoos, injecting drugs
- About 20% of persons have no known exposure to the virus

- This is only one type of ‘viral hepatitis,’ others include Hep A and Hep B, both of which are vaccine preventable

Risk Factors for Transmission of Hepatitis C

Hepatitis C: Progression of Disease

HCV is common

About 3.5 million persons in USA have it

About half of them do not know they have it

Leading cause of liver cancer and liver transplants nationwide

American Indian/Alaska Native people have about 3x the national rate of HCV related mortality

HCV: how
do we
diagnose
it?

Blood test, check for antibodies and
confirm with viral load test

Screening recommended for all adults
and adolescents, and more frequently
for persons at risk of disease (such as
drug use/injection associated with
national opioid and meth epidemics)

HCV Screening Coverage %, Birth Cohort, Federal SUs, 2022

Treatment options: Then, and Now

HCV: how we treat it

Old days: long treatment, injections, side effects, didn't always work

Now: short treatment, almost no side effects, works almost 100%

Cost is not a barrier! Some facilities may need to do paperwork and start treatment 2-3 week after diagnosis

Goal of Treatment

- **SVR12 (cure) of HCV** is associated with:
 - 50% Reduction in All-cause Mortality
 - 70% Reduction of Liver Cancer
 - 90% Reduction in Liver Failure

SVR: Sustained Virological Response

Lok A. NEJM 2012; Ghany M. Hepatol 2009; Van der Meer AJ. JAMA 2012

HCV who can get treated

Everyone

Some service units have over 100 patients who need linking to care. CHR's can help!

Raise awareness of HCV testing and treatment in community

Identify barriers to care and advocate with providers and patients, email us as needed we are here to help

Example 1 of 3

65 year old woman has bleeding in throat, goes to IHS emergency room

Urgently transported by helicopter to more advanced hospital

Diagnosed with esophageal varices and late-stage liver disease due to chronic HCV infection

Example 2 of 3

She had no known exposures to HCV, lived in remote location, did not drink or smoke and led a very healthy life

Looking at her own history, she remembered she had experimented with drugs in her 20s for a short time with a boyfriend who used, including snorting and injecting

Example 3 of 3

Patient was
successfully
treated for HCV
and cured

Got well enough
to travel to see
grandchildren

Hep C Poster 1

Hep C Video: Hep C is Everyone's Responsibility – For Communities

HCV cure

“When I can tell the patients they are cured, we both cry. Every time.”

-
Pharmacist, Claremore hospital, IHS
